Ecosystem

What is Ecosystem?

An ecosystem includes all of the living things (plant, animals and organisms) in a given area interaction with each other also also with their non-living environment (Weather, Earth, Sun, Soil, climate, atmosphere).

Ecosystem are the Foundation of the Biosphere and they determine the health of entire earth System.

Threats to Ecosystem.

Ecosystem. Anything attempts to alter the balance of the ecosystem potentially threatens health and existence of the ecosystem. Some of these threats are not overly worrying as they may be naturally resolved provided the natural condition are restore.

1. Habitat Destruction

Economics activities such as logging mining Farming and Constructive often involve clearing out place with nature vegetative cover. very often tampering with one factor of the ecosystem can have a ripple effect on it and affect many more or all other factors of the ecosystem.

2. Pollution

Water, land and air pollution all together play a human caused & crucial role in the health of ecosystem, pollution may be natural human caused, but regardless they eventually release destructive agents of chemicals & pollutants into the environment of living things. This can be, for example, it can be create imbalance the ecological balance by simulating plant growth and causing the death of the fish due to pollution resulting from lack of oxygen.

3. Overharvesting

Rare species, game and special plants all do get scarce from time to time as a result of overharvesting or humans dependence on them. Overharvesting leads to reduction in population numbers. Overharvesting and distribution leads, with an overall decrease in recruitment. Lots of animals, the plants have reached their maximum sustainable level and others will soon
